Report Overview

A multipoint average thermometer is a temperature measuring instrument used to measure the temperature of multiple points in a process pipeline or container. The thermometer consists of several temperature sensors, usually thermocouple or resistance temperature detection (RTD), which are distributed along the length of the process pipeline or container. Sensors are connected to a data collection system, which collects temperature readings from each sensor and calculates the average temperature. Multi point average thermometers are typically used for industrial applications where accurate and reliable temperature measurements are crucial for process control and safety. It is particularly useful in processes where temperature changes along the length of process pipelines or containers, such as in heat exchangers, reactors, and distillation towers. The multi-point average thermometer is more accurate than the single point thermometer in measuring the temperature distribution of the process pipeline or container, because it takes into account the temperature change over the length of the pipeline or container. This allows for more precise control of the process and improves product quality.
