Abstracts

A multiport rotary union is a mechanical device that allows the transfer of fluids (liquids or gases) from a stationary source to a rotating component. It is designed to handle multiple fluid ports simultaneously while enabling rotation, making it ideal for applications where rotation is needed but fluid flow needs to be continuous and uninterrupted. The union typically consists of a rotating component (rotor) and a stationary component (stator), with sealing elements ensuring no leakage while maintaining the flow. Multiport rotary unions are commonly used in applications where there are multiple fluid transfer points in machinery or equipment that requires rotation, such as in robotics, rotating equipment, and manufacturing machinery.

The global Multiport Rotary Union market size was estimated at USD 537.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
