## Abstracts

A multispot laser photocoagulator is an advanced medical device that plays a crucial role in ophthalmology. It is designed to emit multiple laser spots simultaneously, which significantly enhances the efficiency and precision of various retinal and ocular treatments. This device comes in different types, segmented by wavelength, working mode, structure, and scanning mode. For instance, based on wavelength, it can be 532 nm green, 577 nm yellow, or 659 nm red, each having unique absorption properties in the eye and thus being suitable for different conditions. In terms of working mode, it can operate in continuous wave or pulsed mode, with the latter offering more precise energy control. Structurally, it can be either integrated for stable operation or modular for flexibility. As for scanning mode, it can use pattern or random scanning depending on the complexity of the lesion. The applications of a multispot laser photocoagulator are wide - ranging. It is extensively used in treating diabetic retinopathy, where it performs panretinal photocoagulation to prevent new blood vessel growth and macular edema treatment to protect vision. It also addresses retinal vascular diseases like vein occlusion and angiomatous proliferation, retinal tears and detachments to prevent further damage, macular diseases such as age - related macular degeneration and central serous chorioretinopathy, and even glaucoma through procedures like iridotomy and cyclophotocoagulation. Overall, this device is an invaluable tool in modern ophthalmic medicine, enabling more effective and timely treatment of a variety of eye disorders.

The global Multispot Laser Photocoagulator market size was estimated at USD 94.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
