Abstracts

A multiwheel classifier is an advanced air classification system designed to efficiently separate fine and coarse particles based on size and density using multiple classification wheels. Unlike single-wheel classifiers, multiwheel classifiers feature multiple rotor wheels operating simultaneously within the same system, significantly increasing classification capacity, precision, and efficiency. The classifier uses controlled airflow and centrifugal force to separate particles, directing fine materials to the collection system while allowing coarser particles to return for further grinding. This technology is widely used in industries requiring ultra-fine classification, such as mineral processing, chemicals, pharmaceuticals, and battery materials.

The global Multiwheel Classifier market size was estimated at USD 267.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.10% during the forecast period.
