Report Overview

Incinerator is the machinery used for generation of energy from combustion of waste. During the incineration process, several harmful waste materials are converted into gases, heat energy, and particles. These are later used for generation of energy in the form of electricity. The method also helps in the removal of dissolved gases such as carbon dioxide. This method is utilized in the activated sludge process in solid waste treatment facilities across the globe due to its reliability. Increase in significance of the incineration method is estimated to drive the demand. However, regional differences are expected to remain largely unchanged due to the varied expenditure on municipal infrastructure development in individual countries.

The global Municipal Solid Waste Incineration market size was estimated at USD 42500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
