Abstracts

Muscle-on-a-Chip is a biosimulation technology used to simulate the structure and function of human muscle tissue. This technology is usually implemented on a microfluidic chip or a microbial chip. Artificially cultured muscle cells are planted on the chip through tissue engineering and biotechnology methods to simulate various characteristics of real muscles, such as the contraction and movement function of muscle fibers. Muscle-on-a-Chip can be used to study the pathogenesis of muscle diseases, evaluate the efficacy and toxicity of drugs, and develop new treatments. This technology provides a highly controllable and reproducible experimental platform for muscle-related research, helping to advance the field of muscle medicine. As an emerging market segment in the biomedical field, the muscle chip market has gradually attracted widespread attention from the industry in recent years. Muscle chips can simulate the structure and function of muscle tissue, providing a powerful tool for the research of muscle-related diseases, drug development and personalized medicine. Muscle chips have broad application potential in multiple fields, including diagnosis of muscle diseases, drug screening, toxicity testing, sports rehabilitation, and personalized medicine. By simulating the physiological and pathological processes of muscle tissue, muscle chips can help researchers gain a deeper understanding of the pathogenesis of muscle diseases, accelerate drug development, and improve treatment effects. Overall, the muscle chip market has broad development prospects and huge market potential.

The global Muscle-on-a-Chip market size was estimated at USD 291.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 26.10% during the forecast period.
