Abstracts

Muscle relaxants drugs, also known as skeletal muscle relaxants, are a class of pharmaceutical agents primarily used to alleviate muscle spasms, pain, and stiffness associated with musculoskeletal conditions such as back pain, neck pain, fibromyalgia, multiple sclerosis, and certain neurological disorders. These medications function through various mechanisms, including central nervous system depression to reduce muscle hyperactivity or direct action on skeletal muscles to interfere with contraction processes, and they are typically categorized into two groups: antispasmodics, which target the central nervous system (e.g., benzodiazepines, cyclobenzaprine), and antispastics, which act peripherally on muscles (e.g., dantrolene, baclofen). While some muscle relaxants require a prescription due to their potential for dependence, sedation, or abuse, others are available over-the-counter in milder formulations, often combined with analgesics, to provide symptomatic relief for acute or chronic muscular discomfort.

The global Muscle Relaxants Drugs market size was estimated at USD 6934.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.65% during the forecast period.
