Report Overview

Step index fiber is a type of fiber with a step index distribution. The refractive index of the fiber core is higher than that of the cladding, causing the input light energy to continuously generate total reflection and advance at the interface between the fiber core and the cladding. The refractive index of this fiber core is uniform, while the refractive index of the cladding is slightly lower. The refractive index from the center core of the optical fiber to the glass cladding is abrupt, with only one step, so it is called a step index multimode fiber, abbreviated as a step fiber, also known as a mutation fiber.
