Abstracts

MVR falling film evaporators are energy-efficient industrial systems designed for concentrating liquid solutions by removing water or other solvents through a process that combines mechanical vapor recompression (MVR) and falling film evaporation; in this setup, feed liquid is distributed as a thin film along the interior surfaces of vertical tubes, while vapor generated during boiling is mechanically compressed to raise its temperature and pressure, allowing it to serve as the heating medium in a closed-loop cycle that significantly reduces steam consumption and operational costs compared to traditional evaporators. These systems are widely used across sectors such as food and beverage (e.g., dairy, fruit juice concentration), chemicals, pharmaceuticals, wastewater treatment, and desalination, where precise thermal efficiency, minimal product degradation, and scalability are critical requirements.

The global Mvr Falling Film Evaporator market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
