Abstracts

The MVR (Mechanical Vapor Recompression) forced circulation crystallizer is a type of industrial crystallizer used for the separation and purification of solids from a liquid solution. It operates by continuously circulating the solution through a crystallization chamber, where the solution is heated to its saturation point, causing crystallization to occur. The MVR system utilizes a mechanical vapor compressor to recycle and compress the vapor produced during the process, which is then used as a heat source to maintain the required temperature and concentration in the crystallizer. This energy-efficient design reduces energy consumption and operating costs while improving the overall efficiency of crystallization processes used in industries such as chemical manufacturing, pharmaceuticals, and mining.

The global Mvr Forced Circulation Crystallizer market size was estimated at USD 185.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
