Abstracts

Mycorrhiza-based fertilizers represent a specialized category of agricultural inputs that incorporate beneficial symbiotic fungi—specifically mycorrhizae—which form mutualistic associations with plant roots to enhance nutrient and water uptake, improve soil structure, and increase resilience to environmental stressors such as drought or soil salinity. Unlike conventional fertilizers that directly supply nutrients, these products function by extending the root system's effective reach through fungal hyphae, thereby improving the plant's ability to access existing soil resources while reducing dependency on synthetic additives. They are often formulated as soil amendments, granules, or liquid inoculants containing propagules (spores or colonized root fragments) of mycorrhizal species such as *Glomus* or *Rhizophagus*, and are particularly valued in sustainable agriculture, horticulture, reclamation projects, and organic farming systems for their role in promoting soil health and reducing chemical runoff.

The global Mycorrhiza Based Fertilizer market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
