Abstracts

Myelodysplastic syndromes (MDS) represent a group of diverse bone marrow disorders characterized by ineffective hematopoiesis, resulting in peripheral blood cytopenias and a heightened risk of progression to acute myeloid leukemia (AML). These clonal stem cell diseases involve dysplastic and often hypercellular bone marrow with abnormal cell maturation, leading to insufficient production of functional blood cells. MDS is primarily diagnosed in older adults, with median age at diagnosis around 70 years, and its etiology can be idiopathic, therapy-related (following chemotherapy or radiation), or associated with certain genetic predispositions. The disease spectrum ranges from lower-risk forms with relatively indolent courses to higher-risk categories that behave more aggressively, necessitating risk-adapted treatment strategies including supportive care, growth factors, immunosuppressive therapy, hypomethylating agents, and allogeneic hematopoietic stem cell transplantation for eligible patients.

The global Myelodysplastic Syndrome market size was estimated at USD 2130.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
