Report Overview

N-Hydroxyethanimine, also known as acetohydroxamic acid (AHA), is a synthetic organic compound with the chemical formula $C_2H_3NO_2$. It primarily functions as a urease inhibitor, blocking the enzyme urease, which is responsible for the hydrolysis of urea into ammonia and carbon dioxide. This property makes it valuable in medical applications, particularly for treating urinary tract infections caused by urease-producing bacteria, such as *Proteus* species, as well as in managing kidney stones and hepatic encephalopathy. Beyond healthcare, N-Hydroxyethanimine has niche applications in industrial and agricultural sectors, where urease inhibition is required to control ammonia release in fertilizers or wastewater treatment. The compound's market demand is driven by its therapeutic efficacy in urology and nephrology, though regulatory constraints and potential side effects may limit broader adoption. Growth opportunities exist in expanding its use in chronic kidney disease management and precision agriculture, while competition from alternative treatments and high production costs pose challenges. The market is expected to see steady growth, supported by increasing urinary tract infection cases and advancements in pharmaceutical formulations.
