Report Overview

N-type double-sided PERT cell is a passivated emitter back surface fully diffused cell, using N-type silicon as the substrate, which has the advantages of high minority carrier lifetime and no light-induced attenuation. Due to the use of boron-doped silicon substrates in conventional P-type batteries, boron-oxygen bonds are easily formed after long-term exposure to light, and electrons are captured in the matrix to form recombination centers, resulting in 3-4% power attenuation; while N-type double-sided PERT batteries use N-type silicon substrate, phosphorus-doped matrix makes the cell almost no light-induced attenuation.

The global N Type Double Sided Pert Battery market size was estimated at USD 18542.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.85% during the forecast period.
