Abstracts

Na-ion hard carbon material refers to a class of disordered, non-graphitic carbonaceous substances engineered specifically for use as an anode in sodium-ion batteries, characterized by a predominantly amorphous structure with limited graphitic domains and a high concentration of defects and nanopores that facilitate reversible sodium ion intercalation and storage through adsorption and pore-filling mechanisms, enabling higher capacity and improved cycling stability compared to graphite anodes which are incompatible with sodium ions due to larger ionic radii and different intercalation thermodynamics.

The global Na Ion Hard Carbon Material market size was estimated at USD 125.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.50% during the forecast period.
