Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on NAND Master Control Chip competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. NAND controller chips are used in solid-state storage devices (SSDs, eMMC, UFS, etc.). They manage NAND flash memory read and write scheduling, address mapping (FTL), garbage collection, bad block management, error correction (ECC), caching strategies, encryption, and host interface protocol implementation. Global shipments of these NAND controller chips are expected to reach approximately 450 million units in 2024, with an average unit price of approximately \$6 per unit. A single high-performance controller chip production line (design, tapeout, and testing capabilities) at a mature manufacturer can produce approximately 50 million units annually. Upstream suppliers include logic process foundries, IP core providers (ECC/LDPC, encryption, and cache management), SRAM/DRAM or SRAM-assisted cache designers, packaging and testing vendors, EDA tool and verification service providers, and interface IP design companies. In terms of gross profit margin, a company designing controller chips can usually achieve a gross profit margin of 25% to 40% in a good market environment. However, this may drop to 10% to 20% if faced with rising costs or intensified competition. Each SSD, storage module, or device consumes as many controller chips as it is used. According to parameter classification, NAND controller chips can be subdivided into several categories: client/consumer-grade controllers (for standard interfaces such as SATA, NVMe, and UFS), industrial-grade controllers (high durability, high temperature and wide operating temperature), high-performance controllers (for PCIe 4.0/5.0, high IOPS/low latency), encryption/security controllers (with built-in hardware encryption, secure boot, and TEE support), enterprise-level controllers (for data centers, with higher durability and reliability), and HCI/hybrid

controllers (supporting hybrid cache architectures and Host-Managed NAND protocols such as Open-channel).

The global NAND Master Control Chip market size was estimated at USD 2700.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.70% during the forecast period.
