Abstracts

Nano drug preparation systems refer to specialized equipment and technologies used to fabricate, formulate, and process pharmaceutical compounds at the nanoscale, typically involving nanoparticles, liposomes, nanocrystals, or other nanostructured carriers designed to enhance drug solubility, stability, bioavailability, and targeted delivery. These systems often integrate techniques such as high-pressure homogenization, nanoemulsification, spray drying, or microfluidics to achieve precise control over particle size, distribution, and surface properties, enabling the development of advanced therapeutics like nanomedicines for oncology, neurology, and infectious diseases, with applications spanning both small molecules and biologics. The market for such systems is driven by increasing R&D investment in nanotechnology-based therapeutics, growing demand for personalized medicine, regulatory support for innovative drug delivery platforms, and the need to overcome limitations of conventional formulations, though it faces challenges related to high development costs, scalability issues, and stringent regulatory requirements for nanomaterial safety and characterization.
