## Abstracts

At present, the production of nano silicon powder mainly adopts two methods: top-down and bottom-up. The former uses physical methods to continuously break down block shaped silicon raw materials from large to small to reach the required size, while the latter uses physical or chemical methods to decompose or crack silicon source materials and obtain the required size of nano silicon particles through deposition. The main methods of research include chemical vapor deposition, plasma evaporation condensation, and mechanical grinding. Due to the late start of research and development of nano silicon powder in China, the production level is relatively backward, mainly relying on mechanical grinding method. Enterprises from countries such as the United States and Japan started their research on nano silicon powder earlier. Companies such as Emperor of Japan and DuPont in the United States can use plasma evaporation condensation to prepare nano silicon powder.
