Abstracts

Nanobody humanization services involve genetic engineering to modify the sequences of nanobodies (VHH or VNAR) derived from non-human species such as camels or sharks, aligning their framework regions (FR) as closely as possible to human antibody sequences. This reduces their immunogenicity in the human body and improves their safety and compatibility in clinical treatment and diagnostic applications. This service typically includes sequence analysis, humanization design, affinity-restoring mutations, expression verification, and functional testing. It is widely used in the development of humanized nanobody drugs, targeted diagnostic probes, and biosensors, and is a key step in promoting the clinical translation of nanobodies.

The global Nanobody Humanization Service market size was estimated at USD 106.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
