## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Nanocrystalline C-Cores competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Nanocrystalline C-Cores production reached approximately 7,800 K units, with an average global market price of around US\$ 15 per unit. Nanocrystalline C-Cores are advanced magnetic core components engineered for high-efficiency electromagnetic applications, distinguished by their unique material composition, crystalline structure, and "C"-shaped geometry. At their core, these cores are fabricated from nanocrystalline soft magnetic alloys—typically iron-based composites (e.g., iron-silicon-boron, Fe-Si-B, with trace elements like copper or niobium) that undergo a specialized manufacturing process: the alloy is first melted and rapidly quenched into thin, amorphous metal ribbons, then heat-treated at controlled temperatures (300-500 °C) to induce the growth of ultra-fine nanocrystals (5-50 nanometers in size) within the amorphous matrix. This nanocrystalline structure grants the material exceptional soft magnetic properties: extremely high magnetic permeability (10-100 times greater than traditional silicon steel), low coercivity (minimizing energy loss from magnetic hysteresis), and excellent saturation magnetic flux density—critical for reducing power dissipation in electromagnetic devices.

The global Nanocrystalline C-Cores market size was estimated at USD 117.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
