Report Overview:

Nanofiltration (NF) is a membrane filtration process that falls between ultrafiltration and reverse osmosis in terms of pore size and separation capabilities. NF membranes have smaller pores than microfiltration and ultrafiltration membranes but larger pores than reverse osmosis membranes. This intermediate pore size allows nanofiltration to separate ions, small molecules, and larger molecules based on size and charge. NF systems and membranes find applications in various industries where selective separation and concentration of solutes are required.

The Global Nanofiltration Systems and Membranes Market Size was estimated at USD 548.15 million in 2023 and is projected to reach USD 705.68 million by 2029, exhibiting a CAGR of 4.30% during the forecast period.
