Report Overview

Titanium dioxide nanoparticles, also called ultrafine titanium dioxide, are particles of titanium dioxide (TiO₂) with diameters less than 100 nm. Ultrafine TiO₂ is used in sunscreens due to its ability to block UV radiation while remaining transparent on the skin, and its photocatalytic sterilizing properties also make it useful as an additive in construction materials, for example in antifogging coatings and self-cleaning windows. The health risks of ultrafine TiO₂ from dermal exposure on intact skin are considered extremely low, and it is considered safer than other substances used for UV protection. However, in the context of TiO₂ production workers, inhalation exposure potentially presents a lung cancer risk, and standard hazard controls for nanomaterials are relevant for TiO₂ nanoparticles.
