Report Overview

Nanoscale drug delivery devices that are stimuli responsive respond dynamically to changes in the environment. The stimuli could be in the form of changes in temperature, photons, pH, or magnetic fields. Disease process which upset homeostasis can lead to environmental changes that can be exploited by stimuli-responsive therapeutics. The goal of nanomedicine is to design personalized therapeutic agents that tailor themselves to the needs of an individual patient. Nanomedicine can be used to achieve personalized medicine by exploiting cellular and molecular (e.g., nanoscale) properties unique to certain disease processes. The ability to deliver therapeutic agents in a controllable and targeted manner is a major goal of modern medicine. Controlled delivery devices can enhance the efficacy of a drug by exerting spatiotemporal control over its distribution within the body. Nanoscale carriers are one subclass of delivery devices that have emerged as a powerful way of achieving this goal. They can be used to either sustain the release of drugs within a therapeutic window over an extended period of time or limit side effects by targeting therapeutic agents to specific locations in the body. Because of their size nanocarriers can remain in the blood stream without blocking the microvasculature or sedimenting into low shear stress regions and can be designed to escape the blood vessels to deliver drugs to specific cells or tissue.

The global Nanoscale Drug Delivery Devices market size was estimated at USD 4850.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
