Abstracts

Narrow linewidth single-mode fiber laser is a laser with extremely low spectral linewidth. It usually uses single-mode fiber as the laser gain medium and achieves highly single-mode laser output through the characteristics of the fiber. Compared with traditional lasers, narrow linewidth single-mode fiber lasers have narrower spectral widths, which means that the laser beam it emits has more precise wavelength control and higher frequency stability. Due to the structural characteristics of the optical fiber, the propagation mode of the laser beam is only a single mode (i.e., single mode), which makes the spatial distribution of the laser output more concentrated, with better directivity and high power density. Therefore, narrow linewidth single-mode fiber lasers are widely used in fields that require high-precision wavelength control, frequency stability, and high single-mode quality factors, such as spectral analysis, precision measurement, lidar, communication systems, and other scientific research and industrial applications. Its excellent performance enables it to play an important role in scenarios with high precision requirements such as high-sensitivity detection, precision machining, and optical communications.

The global Narrow Linewidth Single Mode Fiber Laser market size was estimated at USD 201.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
