Abstracts

A nasal lacrimal tube stent is a medical device used in ophthalmology and otorhinolaryngology to treat nasolacrimal duct obstruction, a condition that impedes normal tear drainage from the eye to the nasal cavity. This stent, typically made of biocompatible materials such as silicone or polyurethane, is inserted through the lacrimal system to maintain patency, prevent scar tissue formation, and facilitate healing following surgical procedures like dacryocystorhinostomy (DCR). It serves as a temporary scaffold that ensures the newly created or reopened drainage pathway remains functional during the postoperative period, reducing the risk of restenosis and improving surgical outcomes for patients suffering from epiphora (excessive tearing) or recurrent infections.

The global Nasal Lacrimal Tube Stent market size was estimated at USD 58.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
