Abstracts

A nasal periosteal elevator is a specialized surgical instrument designed for use in rhinoplasty and other nasal surgeries, characterized by its slender, flat, or curved tip that allows surgeons to gently and precisely lift the periosteum—the dense layer of connective tissue covering the nasal bones—from the underlying bone structure without causing unnecessary trauma or damage to surrounding tissues. This tool is essential for creating subperiosteal pockets, facilitating bone reshaping, graft placement, or implant insertion, and its design often includes ergonomic handles for optimal control and tactile feedback during delicate dissections.
