## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Natural 3D Hydrogel competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Natural 3D hydrogel is a type of three-dimensional porous network structure material with natural biological macromolecules as the matrix, formed by molecular chain self-assembly or physical/chemical cross-linking. Its water content is usually more than 90%, and it has both tissue-like mechanical properties and biologically active functions. Its core features include: natural origin of materials - the matrix is derived from natural polysaccharides or proteins such as collagen, hyaluronic acid, sodium alginate, etc., and the active sites such as RGD sequence and glycosaminoglycan chain retained on the molecular chain can mediate cell adhesion and signal transduction; structural topological biomimetic - micron-scale pore structure is formed through electrostatic interaction, hydrogen bond complexation or enzymatic cross-linking, and the pore size (10-500 $\mu$ m) is similar to the scale of the extracellular matrix (ECM) fiber network, supporting the diffusion of nutrients/metabolic waste and three-dimensional cell migration; functional dynamic responsiveness - some systems (such as pH-sensitive chitosan/alginate composite gel) can swell/contract with changes in microenvironment pH, or regulate cell phenotype through ligand-receptor interaction (such as laminin-integrin), and have both cell carrier and biological signal regulation functions in tissue engineering.

The global Natural 3D Hydrogel market size was estimated at USD 208.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
