Abstracts

Natural gas dehydration is a critical process within the natural gas value chain that involves the removal of water vapor from raw natural gas to meet pipeline and commercial specifications, primarily to prevent hydrate formation, corrosion, and operational inefficiencies caused by free water in transmission systems. This process is typically achieved through absorption using glycol-based solvents, such as triethylene glycol (TEG), or adsorption using solid desiccants like molecular sieves, depending on the required dew point suppression and specific operational conditions.

The global Natural Gas Dehydration market size was estimated at USD 3450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
