Abstracts

Natural gas to methanol is a chemical process that converts methane, the primary component of natural gas, into methanol through catalytic reforming?typically via steam methane reforming (SMR) or autothermal reforming (ATR)?followed by methanol synthesis, producing a versatile liquid chemical widely used as a feedstock in manufacturing formaldehyde, acetic acid, and methyl tert-butyl ether (MTBE), as an alternative fuel or fuel additive, and as a solvent in various industrial applications. This conversion leverages abundant natural gas reserves, offering an economically attractive pathway to monetize stranded or low-cost gas, while providing a cleaner-burning liquid fuel alternative that can be more easily stored and transported than gaseous fuels, thereby enhancing energy security and supporting the transition to lower-carbon energy systems.

The global Natural Gas To Methanol market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
