Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on NaY Zeolite competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. NaY Zeolites are sodium-type molecular sieves with a Y-shaped crystal structure. They are alkali metal aluminosilicates with a three-dimensional porous structure, capable of adsorbing molecules with a critical diameter not exceeding 10 Å. They have wide applications in adsorption separation, catalysis, and ion exchange. The upstream mainly involves raw material supply, including basic chemical raw materials such as silicon sources (e.g., silica sol, water glass), aluminum sources (e.g., sodium aluminate, aluminum hydroxide), and sodium sources (e.g., caustic soda). The downstream application market is primarily in the petrochemical industry. Global sales in 2024 were approximately 350,000 tons, with an average market price of approximately US\$2,200 per ton. The industry's gross profit margin is in the range of 20%-35%. NaY Zeolites/NaY molecular sieves are essentially the sodium form of Y-type zeolites, and their industry demand is primarily driven by the refining catalysis sector. Simultaneously, Y-type and NaY molecular sieves, due to their large pore size and stable acidity, are also considered important materials in adsorption and environmental applications such as gas separation, CO₂ adsorption, and VOC treatment. Furthermore, through modification routes such as ultrastable Y and hierarchical multi-level porous Y, their applications have expanded into high-value VGO cracking and green catalysis. However, the industry also faces multiple obstacles: the traditional hydrothermal method for preparing NaY requires high-purity silicon-aluminum sources, alkali, and a long crystallization time, and is generally considered to be costly and energy-intensive. This has prompted companies and academia to explore alternative processes using solid wastes such as coal ash and spent FCC catalysts as low-cost aluminum-silicon sources.

The global NaY Zeolite market size was estimated at USD 770.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
