Report Overview

NDIR gas sensors use the infrared absorption properties of gas molecules (e.g., CO₂) to calculate their concentration. Therefore, the NDIR gas sensor is equipped with an infrared light source that emits infrared rays and an infrared sensor that detects infrared rays. The infrared light is directed at the gas in the measuring tube and part of the light is absorbed by the gas molecules to be measured. Subsequently, the rest of the infrared light hits the filter and reaches the infrared detector. Ideally, only the gas to be measured absorbs light of the corresponding wavelength. However, since the gas mixture contains a variety of gases, the absorption regions may overlap, thus enhancing cross sensitivity. The interference part must either be tested for compensation (to avoid false measurements) or avoided by clever selection of spectral ranges. With the NDIR sensor, more than 100 different gases can be detected from ppm to percentage. In many applications, this is the preferred method because the measurement method is non-contact and non-consuming.

The global NDIR Sensors market size was estimated at USD 857 million in 2023 and is projected to reach USD 1643.07 million by 2032, exhibiting a CAGR of 7.50% during the forecast period.

North America NDIR Sensors market size was estimated at USD 252.94 million in 2023, at a CAGR of 6.43% during the forecast period of 2024 through 2032.
