Abstracts

Near-field acoustic holography technology is a method that uses the sound field response distribution measured by a microphone array with a certain geometric shape as the input of a three-dimensional sound field model to reversely calculate and reconstruct the distribution of acoustic physical quantities in the near field of the sound source or on the surface of the sound source. Near-field acoustic holography software is based on this technical principle and uses computer algorithms and data processing technology to achieve the identification, positioning and analysis of sound sources. Near-field acoustic holography software can receive and process sound field data from microphone arrays, including preprocessing work such as signal amplification, filtering, and denoising. Using the collected sound field data, the software reconstructs the distribution of acoustic physical quantities in the near field or surface of the sound source, such as sound pressure, particle velocity, etc., through reverse calculation and three-dimensional reconstruction algorithms.

The global Near Field Acoustic Holography Software market size was estimated at USD 162.64 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
