Abstracts

Near Field Beam Profilers are precision optical instruments designed to measure and analyze the spatial intensity distribution, phase, and wavefront characteristics of laser beams directly at or very near the output aperture of a laser source or optical system, providing critical data on beam quality, divergence, mode structure, and alignment without the need for propagation over significant distances. These devices typically employ high-resolution cameras, wavefront sensors, or scanning slit mechanisms to capture detailed beam profiles, enabling accurate characterization essential for applications requiring tight control over laser performance, such as in telecommunications, medical laser systems, material processing, scientific research, and defense technologies where beam integrity directly impacts system efficiency and outcomes.
