Report Overview

Needle coke is used for the production of synthetic graphite and it is the only suitable material for manufacturing of the highest quality, 99% plus pure graphite through graphitisation process. The anode is the negative electrode of a primary cell and is always associated with the oxidation or the release of electrons into the external circuit. In a rechargeable cell, the anode is the negative pole during discharge and the positive pole during charge. The vast majority of lithium-ion batteries use graphite powder as an anode material. Graphite materials are either synthetically-produced (artificial graphite) or mined from the ground (natural graphite), then heavily processed before being baked onto a copper foil to serve as anodes.

The global Needle Coke for LIB Anode Materials market size was estimated at USD 1025 million in 2023 and is projected to reach USD 3203.96 million by 2032, exhibiting a CAGR of 13.50% during the forecast period.
