Abstracts

Negative achromatic lenses are specialized optical components designed to correct chromatic aberration by combining two or more lens elements made from different types of glass, which work together to bring two distinct wavelengths (typically red and blue) to a common focal point while simultaneously producing a negative focal length, resulting in a diverging lens that spreads light rays rather than converging them. These lenses are engineered to minimize color fringing and improve image clarity in applications requiring beam expansion, virtual image formation, or optical system length reduction, making them critical in precision instruments such as telescopes, microscopes, laser systems, and high-performance camera lenses where both chromatic correction and negative power are necessary.

The global Negative Achromatic Lens market size was estimated at USD 75.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
