Abstracts

Negative Focal Length Meniscus Lens is a special optical lens, which consists of a concave surface (smaller radius of curvature) and a convex surface (larger radius of curvature). The center part is thinner than the edge, which can cause the divergence of light. Its outer convex arc is greater than the inner concave arc, forming the characteristic of negative focal length. Negative focal length meniscus lens has the functions of expanding and diverging light, increasing focal length, and reducing numerical aperture. It is widely used in optical systems, laser technology, optical communications and other fields.

The global Negative Focal Length Meniscus Lens market size was estimated at USD 316.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
