Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Negative Pressure Lancing Device competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of Negative Pressure Lancing Device will reach 542,375 million units, with an average selling price of US\$14.1 per unit. The skin consists of two layers: the epidermis and the dermis. From the epidermis down to the papillary layer, there are no dense nerve bundles, so pain is not felt. This area is called the "comfort zone." The area below, with its dense nerve plexus, is called the "pain zone." This comfort zone is only 0.6mm deep. The capillary protrusions within this comfort zone also have a rich blood supply. Therefore, precisely controlling blood collection within this comfort zone can effectively control pain. However, variations in the process accuracy of conventional lancing devices, the speed and force of the spring system, finger tremor, needle movement, and other factors make it impossible to precisely control blood collection within this 0.6mm "comfort zone." Therefore, excessively deep needle insertion results in noticeable pain. The painless lancing device utilizes a negative pressure system that instantly generates negative pressure on the skin, firmly adhering to the skin and preventing the effects of skin movement, ensuring precise control of the needle's depth to within 0.6mm.

The global Negative Pressure Lancing Device market size was estimated at USD 765.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
