Report Overview

Negative Pressure Wound Therapy (NPWT) is especially suitable for multiple exudates, deep wounds or complex dehiscence wounds. NPWT devices can promote wet healing of wounds, manage exudates / secretions, remove dead space, and prevent external contamination to promote secondary or tertiary healing of dehiscence wounds. The NPWT device works by applying a controlled negative pressure to the wound or incision, providing a physical barrier to external contamination, and removing excess wound drainage. In addition, in open wounds, NPWT devices can promote healing by shrinking the edges of the wound and reducing the wound area; stimulating angiogenesis and granulation tissue formation; reducing edema; and improving tissue perfusion.
