Abstracts

Negative resist strippers are specialized chemical formulations designed to remove negative photoresist layers after semiconductor fabrication processes, primarily used in integrated circuit manufacturing and microelectronics production where negative resists are employed for pattern transfer. These strippers function by chemically breaking down the cross-linked polymeric structure of negative resists, which are typically more challenging to remove than positive resists due to their higher chemical resistance and thermal stability, often requiring aggressive solvents, alkaline solutions, or solvent-amine blends tailored to specific resist chemistries and substrate materials. The effectiveness of a negative resist stripper is measured by its ability to completely remove resist residues without damaging underlying layers, metallization, or device structures, while minimizing substrate swelling, corrosion, or unwanted byproduct formation, with formulations often optimized for compatibility with various wafer materials such as silicon, silicon dioxide, and metals like aluminum or copper.

The global Negative Resist Strippers market size was estimated at USD 98.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
