Report Overview

An NTC thermistor is a ceramic semiconductor made with various metal oxides. Their electrical resistance decreases with increasing temperature. A typical temperature range for existing ceramic Negative Temperature Coefficient Thermistors is -80 degrees C to +300 degrees C. This resistance is processed by an electronic circuit to provide temperature measurement. The thermistor itself does not provide any control over heating elements, relays, etc. The thermistor is strictly a sensor and any electrical control would need to be implemented by the circuit utilizing the thermistor.

Conventional ceramic NTC thermistors have been employed in the marketplace for over 70 years; and dominate the thermistor market. The ceramic thermistors are comprised of a metal oxide mix annealed at high temperatures. Companies around the world have used this ceramic technology to produce billions of thermistors annually. Typically, NTC thermistor is the most popular and economic solution for various fields such as home appliance, automotive, telecommunication, computer, medical instruments, industrial sites, etc.

The global Negative Temperature Coefficient Thermistor market size was estimated at USD 624.60 million in 2023 and is projected to reach USD 800.83 million by 2032, exhibiting a CAGR of 2.80% during the forecast period.

North America Negative Temperature Coefficient Thermistor market size was estimated at USD 170.66 million in 2023, at a CAGR of 2.40% during the forecast period of 2024 through 2032.
