Abstracts

Neonatal palm oximeters are non-invasive medical devices designed to monitor blood oxygen saturation (SpO₂) and pulse rate in newborns, particularly in neonatal intensive care units (NICUs), delivery rooms, and during transport. These specialized oximeters utilize sensor technology adapted for the small size and delicate physiology of infants, often incorporating features such as motion artifact reduction, low-perfusion performance, and alarms for hypoxemia or bradycardia. They play a critical role in the early detection of conditions like congenital heart defects, respiratory distress, or infections, thereby aiding in timely clinical intervention. Unlike adult or pediatric models, neonatal palm oximeters are optimized for accuracy in low-weight patients and may include proprietary algorithms to minimize false readings. Their portability allows for continuous monitoring even during procedures or transfers, making them essential tools in improving neonatal outcomes and reducing morbidity and mortality rates in vulnerable populations.

The global Neonatal Palm Oximeter market size was estimated at USD 125.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
