## Abstracts

The significant problem in neonates at birth is management of temperature and this contributes to significant morbidity and mortality. Low birth weight is the major cause of hypothermia and hyperthermia due to decreased thermal insulation as a result of lack of subcutaneous fat. Newborns are prone to develop hypothermia. Neonatal thermoregulation devices are used to regulate the body temperature of newborn babies. With the continuous development of technology, Neonatal Thermoregulation will continue to be updated to improve performance and stability. For example, more advanced sensors and algorithms may be used to improve the accuracy and stability of body temperature measurement. At the same time, more intelligent body temperature regulation instruments may also be developed that can automatically adjust body temperature according to the physiological characteristics and environmental factors of newborns.

The global Neonatal Thermoregulation market size was estimated at USD 557.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
