Abstracts

Neoprene, also known as polychloroprene, is a type of synthetic rubber, which is produced by polymerization of chloroprene. It comprises characteristics such as low oxidization rate and ozone and weathering resistance, which help to extend the shelf life of neoprene-based products, despite exposure to ozone compound and weathering stimulators. In addition, neoprenes resistance to hydrogen gas, natural gas, ammonium salts, mineral oils, silicone oils, greases, and various chemicals is a key factor that boosts the demand for neoprene-based products. Furthermore, fire resistance, high thermal insulation, and lightweight nature of the fabric have increased its use in manufacturing wetsuits/swimsuits. Moreover, enhanced flexibility and adequate surface friction are some of the major advantages of using neoprene for the production of wide range of apparels.

The global Neoprene Fabric market size was estimated at USD 18900.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 0.03% during the forecast period.
