The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Net Cleaning ROV competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of Net Cleaning ROV reached 98,700 units, with an average selling price of US\$6,842.12 per unit and a gross profit margin of 36.5%. Upstream components include propellers, geared motors, washing discs, and pump stations; downstream applications include large fish farms. Net cage systems are crucial infrastructure for marine aquaculture. However, during the aquaculture process, net cages accumulate large amounts of debris and biofouling, hindering water exchange and jeopardizing the safety of aquaculture operations. To address this problem, various cleaning methods have been explored. Early on, manual dredging was the primary method. While simple to operate, it was labor-intensive and inefficient, gradually revealing numerous drawbacks. In the late 20th century, with advancements in machinery, mechanical flushing systems began to be applied to net cage cleaning. These systems utilize high-pressure water jets to remove contaminants, significantly improving cleaning efficiency. However, mechanical cleaning requires a high level of technical expertise and can negatively impact net cage materials and the aquaculture environment. With the rapid development of artificial intelligence and robotics, intelligent net cleaning robots have gradually become a research hotspot. Due to their flexibility, efficiency, and environmental adaptability, these robots can perform precise net cleaning tasks in various marine environments. The Net Cleaning ROV is a key intelligent supporting equipment for deep-sea net cages. The robotic platform is equipped with a jet cleaning component, multiple underwater cameras, underwater lights, and other platform sensors. The entire net cleaning process is fully monitored, and the user operator uses a joystick or console for real-time operation and control. The

optimized structural design enables the net cleaning robot to easily maintain a balanced movement posture. The robot system is equipped with automatic cruising and automatic cleaning modes, which can greatly reduce the operator's workload.

The global Net Cleaning ROV market size was estimated at USD 675.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.30% during the forecast period.
