Report Overview

Netupitant Palonosetron FDC (Fixed-Dose Combination) is a pharmaceutical product designed to prevent chemotherapy-induced nausea and vomiting (CINV), particularly in patients undergoing highly emetogenic chemotherapy (HEC) or moderately emetogenic chemotherapy (MEC). The combination integrates two active ingredients: netupitant, a neurokinin-1 (NK1) receptor antagonist that blocks substance P-mediated pathways, and palonosetron, a potent 5-HT₃ receptor antagonist targeting serotonin-induced emesis. By combining these mechanisms in a single formulation, the FDC enhances patient compliance and simplifies dosing regimens, offering superior antiemetic efficacy compared to monotherapy. It is typically administered orally as a capsule, often in conjunction with dexamethasone, and has gained traction in oncology care due to its extended duration of action, covering both acute and delayed phases of CINV. Regulatory approvals, such as those from the FDA and EMA, underscore its clinical validation, positioning it as a key therapeutic option in supportive cancer care.

The global Netupitant Palonosetron FDC market size was estimated at USD 381420.16 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.69% during the forecast period.
