Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Network Interface Controller Chip for Cloud Computing competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Network Interface Controller Chip for Cloud Computing is core hardware components designed specifically for cloud computing scenarios. In essence, they are application-specific integrated circuits (ASICs) integrated with functions such as data processing, protocol parsing, and traffic management. Their primary role is to enable high-speed, reliable, and intelligent data interaction between cloud computing servers and networks, while adapting to core requirements of cloud computing environments, including virtualization, multi-tenancy, high concurrency, and low latency. Compared with traditional data center or consumer-grade NIC chips, the key difference of cloud computing NIC chips lies in their in-depth adaptation to cloud computing architecture characteristics: for example, they support hardware-level virtualization (such as SR-IOV technology, which can virtualize a single physical NIC into multiple logical NICs to meet the independent network needs of multiple virtual machines), integrate RDMA (Remote Direct Memory Access) functionality to reduce CPU usage during data transmission between cloud servers, and feature flexible traffic scheduling and QoS (Quality of Service) control capabilities (to ensure bandwidth and latency requirements of different cloud services). Additionally, they need to be compatible with network protocols commonly used in cloud computing (such as TCP/IP, VXLAN, GRE, etc.) and support unified management and operation interfaces of cloud platforms. In 2024, the global output of cloud computing network interface controller chips reached 172 million units, with an average selling price of \$2.18 per unit. The upstream segment provides key raw materials, core IP, production equipment, and

technical services for chip design and manufacturing, serving as the fundamental guarantee for chip performance, cost, and production capacity. The downstream segment is the end-application field of cloud computing NIC chips, with core customers being cloud computing infrastructure vendors. These vendors are the direct purchasers of cloud computing NIC chips; they integrate the chips into hardware devices to provide underlying infrastructure for cloud computing: Server manufacturers: Companies such as Dell, HP (HPE), Inspur, and Sugon embed cloud computing NIC chips into the motherboards of cloud servers to produce dedicated servers for cloud computing scenarios (e.g., Alibaba Cloud's "Shenlong" servers, AWS's "Graviton" servers). Cloud Service Providers (CSPs): Leading CSPs like AWS, Microsoft Azure, Alibaba Cloud, and Tencent Cloud. Some top-tier CSPs directly customize NIC chips from chip design manufacturers (e.g., AWS's self-developed NICs supporting "Graviton") to optimize the performance and cost of their own cloud platforms.

The global Network Interface Controller Chip for Cloud Computing market size was estimated at USD 375.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.90% during the forecast period.
