Abstracts

Networks on Chip (NoC) represent a communication architecture for system-on-chip (SoC) designs, replacing traditional shared buses and point-to-point interconnects with a structured, packet-switched network that enables efficient, scalable, and high-bandwidth data transfer between multiple processor cores, memory units, and specialized IP blocks within a single chip. This paradigm addresses the limitations of bus-based systems?such as contention, latency, and limited scalability?by implementing routing strategies, topology (e.g., mesh, ring, or crossbar), and protocols akin to those in computer networks but optimized for on-chip constraints like power consumption, area, and timing. NoCs are critical in modern multicore and many-core systems, particularly in applications requiring high-performance computing, artificial intelligence, data centers, and mobile SoCs, where they facilitate parallelism, reduce communication bottlenecks, and support heterogeneous integration.

The global Networks On Chip (Noc) market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
