Report Overview

Neuraxial anesthesia refers to the administration of anesthetic agents into the epidural or intrathecal space surrounding the spinal cord and its nerves. This method effectively blocks nerve impulses, providing pain relief and anesthesia for surgical procedures or childbirth. Neuraxial anesthesia can involve local anesthetics, opioids, or a combination thereof, tailored to the specific needs of the patient and the nature of the procedure. By targeting the spinal nerves directly, neuraxial anesthesia allows for precise control of anesthesia depth and pain management while minimizing systemic side effects often associated with general anesthesia. It is commonly used in obstetrics, orthopedic surgery, and other procedures where regional anesthesia is advantageous.
