Abstracts

Neurosarcoidosis is the type of chronic inflammatory disease that is characterized by the formation of granulomas. It affects several parts of the body and internal organs such as lungs, brain, lymph nodes, spinal cord and others. Patients suffering from confusion, headaches, inability or change in ability to smell or taste, psychiatric issues, seizures, hallucinations, and speech difficulties are the majorly susceptible to this condition. Sarcoidosis is a worldwide disease affecting all races, ages, and genders. 70% of patients are between 25 and 45 years old. In Europe and Japan, women over the age of 50 are the second highest incidence of sarcoidosis. The onset is rare in those younger than 15 or older than 70. Most studies show that the prevalence of women is slightly higher, and the incidence rate is increasing. The average onset age of NS is between 33 and 41 years old, which is later than other types of sarcoidosis. About 50% of patients have systemic diseases, and 30%-70% have neurological symptoms. All systems of sarcoidosis have a mortality rate of 1% to 5% due to pulmonary, cardiac, or neurologic involvement.

The global Neurosarcoidosis Treatment market size was estimated at USD 5796.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
