Abstracts

Neurosurgical biopatches are biologically-derived materials used in neurosurgery to repair or regenerate damaged neural tissues. These patches are typically made from collagen, extracellular matrix (ECM), or other tissue-derived materials and are employed in surgeries to treat conditions such as brain injuries, spinal defects, or nerve damage. The increasing global prevalence of neurological conditions, such as traumatic brain injuries (TBI), spinal cord injuries, and neurodegenerative diseases, is a key driver for the demand for neurosurgical biopatches. The need for advanced materials that promote tissue regeneration and minimize the risk of complications is fueling innovation in this space. **Market Opportunities:** The rise of regenerative medicine and tissue engineering technologies presents a significant opportunity for neurosurgical biopatches. There is also growing interest in personalized neurosurgery, which could lead to the development of customized patches tailored to the specific needs of individual patients. **Market Challenges:** High market prices, potential for immune rejection, and the long regulatory approval process for biologic materials remain challenges for the widespread adoption of neurosurgical biopatches.

The global Neurosurgical Biopatch market size was estimated at USD 766.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
